910. Forty years of Soviet balneology čtyřicet let sovětského lázeňství. KUCAR B. Hlavní Správa st. Státních Lázní a Zdrcl, Praha Fyziat. Vestn. 1958, 36/2 (67-73)

- An important link in the state system of the health care of the people in the Soviet Union is balneological care. During the 40 yr. of its existence Soviet balneology has developed tremendously. The number of places in spas, sanatoria and the number of beds in spas have increased greatly. A further great development of spas is foreseen in the plan of economic development. Great attention is also paid to natural curative resources, their investigation and use. Soviet balneology, thanks to several balneological research institutes, systematic postgraduate training of the personnel and a number of organizational measures, has reached a high specialist standard. The principles of the physiological teaching of Pavlov are applied on a broad base. The classical institution providing care is the spa sanatorium, well equipped with personnel and all facilities required, where objective examination of the patients can be ensured as well as the best possible comprehensive care. Also the well-developed outpatients' care with perfectly equipped polyclinics render a maximum efficiency of spa treatment possible.

Anomalous hardness of electrolytic chromium. B.

Kocenda (Wojtyła Akad. Tech. Węgry). *Bul. Wydziału Akad. Tech. B. No. 3, 81-8 (1957).*—Electrolytic Cr was examd. in the vicinity of so-called "H craters," both with the vMT-3 (load 300 g., readings of indentations at 487-fold magnification) and with the Reichert no. 1220 (load 187 g., readings at 480-fold magnification) indenters, and showed microhardness of 13,900-14,000 kg./sq. mm. At a very slow rate of loading of the R. indenter, values of 30,000-40,000 kg./sq. mm. were obtained, but they were doubtful since they corresponded to internal H pressures of about 10<sup>4</sup> atm. The reproducibility was satisfactory.

TITLE: Considerations on Fissures in Layers of Electrolytic Hard Chromium in De-Oasing Chromium Plated Machine Parts

PERIODICAL: Technika Motorysacyjna, 1959, Nr 8, pp 303-309 (POL)

ABSTRACT: The author analyzes the cause for the reduced resistance to fatigue and wear of chromium plated machine parts when heated to temperatures of 180-300°C in order to reduce their hydrogen content. Machine parts which are chromium plated in order to increase the resistance to wear are often heated to remove hydrogen deposited in the metal. This is believed to be the cause of the decreased resistance to fatigue of chromium plated parts and of the formation of fissures in the chromium layer. The author claims that the fissures are caused by the expansion of the metal forming the base, mostly steel, which is greater than that of the chromium under the influence of heat. Thus the tensions in the chromium coating exceed its tensile strength, as is shown for some types of steel in Table I. The fact that the width of the fissures increases with the heat, as is shown in the microscopic Photographs 1, 2 and 3, supports the author's theory. The hardness

TITLE:

Fatigue strength of carbon structural steel samples saturated with  
cathode hydrogen

PERIODICAL:

Referativnyy zhurnal. Metallurgiya, no. 1, 1962, 34, abstract 11234  
(Wytrzymalosc zmeczeniowa tworzyw i elementow metalowych, Warszawa,  
Dyskus., 65, 1961, 39 - 43) (Polish)

TEXT:

The effect of the duration of hydrogen cathode saturation on  $\sigma_w$  of  
steel containing (in %) 0.45 C, 0.26 Si, 0.51 Mn, 0.017 P, 0.022 S, 0.11 Cr,  
0.07 Ni, 0.06 Cu, 0.006 Al was investigated. The hydrogen saturation was carried  
out in a normal  $H_2SO_4$  solution with an addition of 0.01 g  $As_2O_5$  per 200 ml of acid  
at 20°C and at 10  $A/dm^2$  current density. An anode a Pt spiral was used. The en-  
durance test was carried out on cantilever samples by alternating symmetrical  
bending with torsion. The duration of hydrogen saturation does affect  $\sigma_w$  of steel  
the saturation of up to 2-hour duration does not change practically  $\sigma_w$ , the sa-  
turation of 3 - 5 hour duration reduces  $\sigma_w$  by 8% on the average. An investiga-  
tion of the microfracture has shown that the fatigue crack is not localized in

Fatigue strength of...

one cross-section of the sample; near the fracture several fatigue cracks are located. The said phenomenon is explained by considering the effect of compressive stresses in the subsurface layer of the sample as well as the notches, which are the subsurface hydrogen bubbles, and the microcracks arising due to the diffusion of hydrogen. However, the hydrogen saturation cannot be the sole reason for the decrease of  $\sigma_w$  of chromium-plated samples, since at chromium-plating  $\sigma_w$  decreases by about 25%, that is by 3 times as much as at the hydrogen cathode saturation. It should be taken into account that at chromium-plating tensile internal stresses arise in Cr layer. There are 10 references.

AUTHOR: Kocahda, S.

TITLE: Fatigue strength of cathode hydrogen-saturated structural carbon steel samples

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 6, 1962, 49, abstract 61294  
("Ermüdungsfestigk. Werkstoffen und Bauelement. Votr. Warschauer  
Tagung 12. - 14. Mai 1960". Warszawa, 1961, 27 - 29, German)

TEXT: The effect of electrolytic hydrogen saturation on  $\sigma_w$  of carbon steel with 0.45% C was investigated. The hydrogen saturation was made in 1 normal  $H_2SO_4$  with an addition of 0.01 g  $As_2O_3$  at a current density of 10 a/dm<sup>2</sup> during 0.5, 2, 3, and 5 hours. A hydrogen saturation during 1 - 2 hours does not cause a reduction of  $\sigma_w$  as yet. A longer saturation reduces  $\sigma_w$  of steel. The reason for this effect of the saturation time on  $\sigma_w$  is on the one hand the notch effect of hydrogen bubbles, and on the other hand the initiation of compressive stresses at the hydrogen diffusion inward the sample. After 3 hours' saturation the negative notch effect suppresses the effect of compressive stresses and  $\sigma_w$  of samples

decreases. Furthermore, hydrogen penetrating into micropores associates in molecules and, as a result, a very high pressure originates which may lead to a local rupture of the material. The internal stresses due to hydrogen combined with the external stresses create a complex stressed state.  $\sigma_w$  of steel is also affected by Rebinder's effect, that is, by the reduction of the surface energy due to the adsorption of hydrogen.

/ The problem of hemophilia from the standpoint of THROMB  
Thrombokinase. J. Kocher (Kurumata ROH, Rumburk-  
 Podkajl, Czech.). Folia Haematol. 73, 180-221(1955).—  
 A study was made of the role of tissue thrombokinase (TK)  
 in the pathogenesis of hemophilia. The release of tissue  
 TK can be induced if pressure is applied to the tissues af-  
 ter the needle stab. If heparin is used, the normal tissue  
 TK is not immediately released, but occurs a little later.  
 The release of the tissue TK in hemophilic individuals oc-  
 curs much sooner than in normal persons, but occasionally  
 is delayed. The TK is important in hemophilia for the con-  
 trol of both normally healing and inflamed wounds. In  
 one obtained skin fluid from normal and from hemophilic  
 persons had the same effect on both hemophilic and normal  
 blood. Natural and tissue TK seem to be 2 different sub-  
 stances. The hemophilic tissue TK alone was not able to  
 induce coagulation, nor did it make hemophilic blood nor-  
 mal. It does not give rise to plasminogen or to the coagu-  
 lating globulin and is not identical with them. However,  
 anal wound healing is aided by tissue TK. 68 references.

APPROVED FOR RELEASE: 09/18/2001  
3211. Biochemistry of the Blood: Evaluation of the polarographic activity of blood sera in the Bredtka test. ROBERT A. ONCOLOGICAL INSTITUTE  
Neoplasia 1958, 54 (1958-1960) Graphs 5 Tables 1  
Three types of modifications in the technique and evaluation of the Bredtka test were reviewed and it was shown that none of these has resulted in new information on the polarographic properties of deproteinized sera. Even apparently quite different methods of evaluation, such as the protein index, or comparison of the height of the double wave with the height of the maximum in the presence of zinc, are closely correlated with the original Bredtka test. Pre-treatment of denaturation with alkali has no significance for diagnosis either. As the most suitable method in evaluating the polarographic activity of deproteinized sera the relative height of the polarographic wave, termed IBR, is recommended.

 TITLE: Optimal statistical sampling plans for a certain type of plant 35  
 SOURCE: Kybernetika, no. 5, 1965, 421-430  
 TOPIC TAGS: quality control, automatic control theory  
 ABSTRACT: The determination is investigated of an optimal statistical sampling plan for quality control in a plant of which it is assumed that the percentage of rejects is  $p$  when the plant is in order, and 100 percent when it is out of order. The probability that the plant may go out of order is  $q$ , but when the plant is out of order it cannot return by itself to the state of proper operation;  $n$  is the number of products not checked;  $m$  is the number of products checked;  $q$  is the maximum permissible number of rejects in  $m$ . The costs of quality control and of repairing the installation, and the losses from letting rejects go through are known. A sampling plan is sought that offers the minimum unit cost, with or without ensuring the given percentage of rejects. Orig. art. has: 10 formulas and 1 table.
